

Super Store Sales Performance Dashboard

Key Insights & Recommendations

1. Sales Performance by Category

The dashboard shows that sales performance differs across the major product categories. Technology, Office Supplies, and Furniture contribute differently to total sales, with Technology and Office Supplies being important contributors to revenue.

2. Sub-Category Performance

The sub-category analysis highlights the products that generate the highest sales within the selected Central region. The top-performing sub-categories provide useful opportunities for the business to focus inventory and marketing efforts.

3. Sales Trend

The monthly and yearly sales trend charts show fluctuations in sales over time. This helps identify periods of stronger and weaker sales performance and can support better planning of inventory and promotional activities.

4. Regional Performance

The dashboard provides a comparison of sales across regions, allowing management to identify how the selected Central region performs relative to other regions.

5. Product Performance

The top-and-bottom product analysis shows that sales are concentrated among certain products. High-performing products can be prioritized, while low-performing products may require further review of their pricing, demand, or marketing.

6. Profitability by Category

Profit contribution varies across product categories. A category generating high sales does not necessarily contribute the highest profit, making profitability analysis important when making business decisions.

7. Overall Business Metrics

The KPI cards summarize total sales, total profit, quantity sold, and number of orders for the selected region. These measures provide a quick overview of business performance.

Recommendations

- Focus marketing and inventory efforts on high-performing categories and sub-categories.
- Investigate low-performing products to understand their weak sales performance.
- Monitor monthly sales patterns to improve inventory and promotional planning.
- Compare sales with profit before making decisions, since high sales do not always mean high profitability.
- Use the regional slicer to compare performance across different regions and identify areas requiring attention.
